Abstract (en)  
[origin: WO2014009595A1] Suction cup (1) in order to grip objects (8) in which case the suction cup (1) comprises a cup part which is flexible at its edges, an edge part at the tip of the cup part which can be pressed against the object and a connection aggregate (2) which is located at the bottom of the mentioned cup part in order to connect the suction pipe creating negative pressure to it and that the flexible cup part comprises a cover (6) or a corresponding wall which cuts the connection from the connection aggregate (2) to/into the suction cup space and that the cover (6) or a corresponding thing comprises a cut, such as an incision (5) or a hole, which penetrates the cover (6) which cut is open from the closed position when the suction cup (1) is being pressed against the object (8) due to the flexible movement of the edge parts of the suction cup (1). Both the suction cup (1) and the cover (6) are made of flexible material and the structure of the suction cup (1) is adjusted to ensure the closed position of the cover (6).
