Abstract (en)
[origin: WO2014011048A1] A bridge body (10) and support elements (20) of a bridge (2) to be erected are first put in a starting position in which the elements (20) are moveably associated with the body (10), and in which the whole of the body (10) and the elements (20) is positioned on the ground. The body (10) and the elements (20) are subsequently put in a final position in which the body (10) is at a higher level than ground level, and in which ends (22) of the elements (20) are positioned on the ground (21), by letting a separate device engage with the whole of the body (10) and the elements (20), and activating the device for exerting a force on the whole as mentioned in an upward direction, while allowing the elements (20) to perform a movement with respect to the body (10).
