Abstract (en)
[origin: EP2873788A1] The present invention relates to a security device for lock cylinders comprising a cylinder body which is formed by a cylindrical body (1) from which a radial prolongation (2) comprising two side faces (2') and a lower area (2'') extends along the entire length of its generatrix, where the cylindrical body (1) is split by an inner cavity (3) partially affecting the radial prolongation (2) without reaching the lower area (2'') thereof, there being in the radial prolongation (2), in correspondence with the inner cavity (3), a weakened central area (5), comprising a continuous security element (6) that can be inserted by pressure and fitted in a groove (7) running continuously along both side faces (2') of the radial prolongation (2) and along the lower area (2'') thereof, as well as running along the weakened central area (5) of the radial prolongation (2), where the configuration of the security element (6) corresponds with the configuration of the groove (7).
