Abstract (en)

An organic light emitting display pixel (P) comprises a driving transistor (DT) for driving an organic light emitting diode (OLED). A first transistor (T1) is controlled by a scan signal (GL) and connected between a reference voltage line (RVL) and a first node (N1) of the driving transistor. A second transistor (T2) is also controlled by the same scan signal (GL) and is connected between a data line (DL) and a second node (N2) of the driving transistor. A storage capacitor (Cst) comprises a first plate with an improved conductive characteristic and connected to the semiconductor layer of the driving transistor and the semiconductor layer of the first transistor. A second plate of the storage capacitor is positioned on the first plate, and connected to the semiconductor layer of the second transistor and a gate electrode of the driving transistor. A pixel electrode of the organic light emitting diode, positioned on the second plate, is connected to the first plate through a contact hole.
