Abstract (en)
[origin: WO2014015967A1] The invention relates to a cam drive (10) comprising a sliding element receptacle, at least one movable carrier plate, at least one driver element and having sliding surfaces between the at least one carrier plate and the at least one driver element, characterised in that at least one sliding surface has at least one clamping device, which adjustably simulates the pressing force (FP) when the working tool is mounted, in order to produce zero backlash between the at least one carrier plate and the at least one sliding receptacle.
