Abstract (en)  
[origin: WO2014012793A1] The invention relates to a method for assembling a refrigeration device (100), in which a machine compartment (102) of the refrigeration device (100) is partially lined by a side wall element (106). According to the invention, in order to connect the side wall element (106) to a housing (200) of the refrigeration device (100), the side wall element (106) is moved in a first direction (I) and then in a second direction (II) which is different from the first direction (I). The invention further comprises a refrigeration device (100) having a machine compartment (102) and a housing (200), wherein a side wall element (106) which partially lines the machine compartment (102) is attached to the housing (200). According to the invention, the side wall element (106) is connected to the housing (200) in a foam-tight manner by an interlocking connection. The invention also comprises a side wall element (106) of this kind.
