Abstract (en)  
In an air-jet spinning device (7), a nozzle block (70) includes a spinning chamber (73) where fibers are swirled by an action of a swirling air current, and a first nozzle (74) that injects air into the spinning chamber (73). The unit controller (10) causes, in a period between a spinning operation end time and a spinning operation start time, a hollow guide shaft member (80) to move from a spinning position that is the position of the hollow guide shaft member (80) during a spinning operation, to a separated position that is farther from the spinning chamber (73) than the spinning position, and causes a second nozzle (84) to inject air into a passage (81), in a state where the hollow guide shaft member (80) is positioned at the separated position and an outlet (83) of the passage (81) is open to the outside.
