Abstract (en)

[origin: CN104674439A] According to the invention, a loom extracts a thread from a storage body (3) of a thread feeder (1) and the thread tension of the threads (40) in the rear part of the storage body (3) in a thread route is controlled by brake equipment. The thread tension is controlled by a regulating device of the brake equipment. The regulating device is at least provided with a working coil (12) and the working current of the working coil is regulated by a current feeding unit of the regulating device for the adjustment of thread tension. An expect value of the working current is output by a processor unit (P) having a data unit. The expect value is special to the thread feeder (1) and is distributed to the thread tension. The working current is regulated to the expect value through the regulating mechanism of the current feeding unit.
