Abstract (en)

[origin: WO2014019942A1] The invention relates to a container (1) made of a flexible plastic material and defining two adjacent spaces (5, 6), a sealing member extending between the two spaces in order to form a sealed border (4) therebetween, wherein a first space (5) comprises, at the end thereof that is opposite the second space (6), a device (2) for opening and sealingly closing a first access to the first space, the second space being shaped such that a cut passing through the second space parallel to the sealing member (4) releases two graspable portions of the container, which are spaced apart from each other such that the sealed border between the two spaces is excised so as to form a second access to the first space that is different from the first access. The insertion of a container for biological material (e.g. a graft) via the first access and the withdrawal thereof via the second access reduce the contamination of the vessel.
