Abstract (en)

[origin: WO2014019004A2] The invention relates to a clip device for holding a textile area (1) of a textile piece (2) for a process of washing the textile piece (2) and a process of drying the textile piece, which clip device comprises at least two opposite clamping surface elements (4) which can be closed by means of a pre-clamping device. By means of said pre-clamping device the textile area (1) introduced between the clamping surface elements (4) and extending parallel to the clamping surface (5) is gripped by application of a pre-clamping force (9) between the clamping surface elements (4) and can be held immovably in the extension surface of the clamping surface (5) relative to the clamping surface elements (4). The clamping surface elements (4) have a clamping surface (5) with a surface area at least as large as the textile area (1), which textile area (1) corresponds to a defined smooth desired surface of the textile piece which is to be produced comprising a desired fold, so that the textile area (1) can be introduced between the clamping surface elements (4) in the form to be produced. The clip device comprises a nozzle for the application of a fluid and/or a washing agent to the textile area for washing the textile area or for application of air to the textile area for smoothing drying.
