Abstract (en)
[origin: WO2014024091A1] It is provided a game platform which includes a receiving board, a magnetic board fixedly hosting magnetic elements, and means for positioning of the magnetic board in a predetermined position. Each magnetic element has either a north polarity or a south polarity facing the receiving board. The receiving board receives a game card at a predetermined position. The game card has sites for receiving magnetic game pieces. The game pieces are distinguishable in accordance with their magnetic polarity by a non-magnetic distinctive feature, like color, shape, weight, scale, and external texture. For determining its position, the magnetic board has a far state and a close state relative to the receiving board, and a spacing mechanism switches between the far state and the close state. The receiving board and the magnetic board are positioned coaxially around a common axis, around which magnetic board is free to rotate. In six equally spaced rotational positions, the magnetic board is locked to a predetermined rotational position. The game card includes closed boundaries shaped for determining its position, site marks for the game pieces, a game content associated to the site marks, and an aligning mark for selecting a desired rotational position.
