Abstract (en)
[origin: WO2014027188A1] The present invention provides a method of stratifying a patient suffering from CKD into one of stages 1-3 of CKD, comprising determining the level of the biomarkers FABP1, γ -GT, AST, creatinine and cystatin C in a sample obtained from the patient and comparing the level of FABP1 in the sample to a control value and the levels of γ -GT, AST, creatinine and cystatin C in the sample to a range of control values for each biomarker, wherein an increased level of FABP compared to the control value and levels of γ -GT, AST, creatinine and cystatin C within the range of control values for each biomarker indicate that the patient 10 suffers from stage 1 CKD or wherein an increased level of FABP1 compared to the control value, levels of γ -GT and AST within the range of control values for each biomarker, and increased levels of creatinine and cystatin C compared to an upper threshold of the control range for these biomarkers indicate that the patient suffers from stage 2 or stage 3 CKD.1
