Abstract (en)

[origin: WO2014023394A1] The invention relates to a method for activating an operating system (35) in a security module (3), wherein the security module (3) is operational either using a first operating system (351) or using a second operating system (352). The method comprises the following steps: the security module (3) is operated using the first operating system (351) and the security module (3) is converted (6) from the first operating system (351) to the second operating system (352). In particular, a primary application (37) introduced into the security module (3) uses an operating system interface (36) to access the respective operating system (35). The concept of the invention furthermore comprises a security module and also the use of a security module in a terminal.
