Abstract (en)
[origin: WO2014067689A1] The invention relates to a discharge device for at least two flowable components. The invention is based on a discharge device (10) comprising a storage container (11) with two storage chambers (12, 13) which are sealed by a sealing element (17) in a closed position of the storage container (11) and from which components can be discharged via component outlets in a discharge position. The storage container is switched over from the closed position to the discharge position by rotating the storage container (11) relative to the sealing element (17). The aim of the invention is to allow a discharge device (10) which can be produced simply and inexpensively. According to the invention, this is achieved in that the storage container (11) and the sealing element (17) are designed as a single piece in the closed position and are connected to each other only by means of connecting pieces. The connecting pieces are designed to tear when the storage container (11) is rotated relative to the sealing element (17) from the closed position into the discharge position, and the component outlets are thus opened.
