Abstract (en)
[origin: WO2014027099A1] The invention relates to a door handle unit (10) for actuating a lock (101) of a movable part (100) of a motor vehicle, in particular of a door, flap, or the like, comprising a door handle (11), which is movably supported on a support element (12) for mechanical opening of the movable part (100) by a user, wherein the door handle (11) has at least one resting position and one working position, a mechanical coupling element (13), which is movably supported on the support element (12) and by means of which a movement of the door handle (11) from the resting position to the working position can be transferred to the lock (101), wherein the door handle (11) and the coupling element (13) mechanically interact and form a movable actuating mechanism (15), and at least one blocking unit (16), which enables a movement of the actuating mechanism (15) for actuating the lock (101) in the normal case and blocks a movement of the actuating mechanism (15) for actuating the lock (101) only in a blocking case. According to the invention, for a blocking case, the blocking unit (16) can be activated by an unusual movement of the actuating mechanism (15).
