Abstract (en)

The present invention generally relates to a method and device for encoding an image. The method is characterized in that it comprises: - obtaining (10) a luminance component ( $L$ ) and each colour component ( $C(i)$ ) of the image, said components belonging to a perceptual space having a metric whose values are a function of the differences between the visual perceptions of two points of said perceptual space, and a perceptual threshold (#E) defining an upper bound of the said metric and enabling a control of the visual losses in a displayed decoded version of the image; - quantifying (11) the luminance component ( $L$ ) of the image; - transforming (12) each colour component ( $C(i)$ ) of the image according to a transform (T) which depends on the perceptual threshold (#E); - quantifying (13) each transformed colour component ( $C(i)T$ ) of the image in order that a metric which is calculated between the image and a decoded version of the image, stays below the perceptual threshold (#E); and - encoding (14) each component of the image  $L Q, C(i)Q T$ . The invention relates also a method and device for decoding a bitstream representing a luminance component and at least one transformed colour component of an image.
