Abstract (en)

[origin: WO2014029560A1] The invention relates to a handle, said handle (10) having a body (12) that can be provided axially on a switching system and an actuating part (14) that is provided protruding from said body (12). Said actuating part (14) extends along the axial direction of said body (12) and an elevation (142) protruding from said actuating part (14) is provided. Such a concept with simple structure and uncomplicated realisation can uniformly use one type of handle sheath (handle sheath with elongated hole) for undertaking the appropriate adjustment, and therefore the assembly process is considerably simplified.
