Abstract (en)

[origin: CN104738918A] A clasp for a bracelet has first and second bracelet fasteners intending to be made integrally with the free end of the bracelet, wherein the bracelet fasteners being closer to each other at the closing wearing positions than the opening positions to close and limit the useful length of the bracelet; locking members keeping the bracelet fasteners at the closing positions; a control member used for the locking members and arranged to unlock the clasp in response to the operation of users; and an adjusting device for adjusting the useful length of the bracelet. The adjusting device comprises an adjusting member for bearing the first bracelet fastener and a locking member possessing a default closing state and an opening state. According to the present invention, the adjusting device is different from the locking member, the locking member is arranged to switch the closing state into the opening state by the action of users, so that the adjusting member can be independent from the closing or opening state of the clasp to shift. The control member comprises a pushing member which can respond to the action of users to shift along a direction basically vertical with the longitudinal direction of the bracelet, and the pushing member is independent from the locking member.
