Abstract (en)

Hearing device with position data, audio system and related methods are disclosed. A method of operating a hearing device is provided. The hearing device comprises a first antenna, a first transceiver coupled to the first antenna, an acoustic output transducer, a microphone, and a primary processing unit, the primary processing unit being coupled to the first transceiver, the acoustic output transducer, and the microphone. The method comprises pairing the hearing device with an audio system; initiating detection of hearing device motion; sending position data indicative of hearing device position to the audio system; wirelessly receiving a first audio stream based on the position data of the hearing device; converting the first audio stream to a first wireless input signal; mixing the first wireless input signal with an audio input signal from the microphone to form an input signal; processing the input signal to form an output signal; and converting the output signal to an audio output signal.
