Abstract (en)  
The present invention relates to a security device for lock cylinders comprising a cylinder body which is formed by a cylindrical body (1) from which a radial prolongation (2) comprising two side faces (2') and a lower area (2'') extends along the entire length of its generatrix, where the cylindrical body (1) is split by inner cavity (3) partially affecting the radial prolongation (2) without reaching the lower area (2'') thereof, there being in the radial prolongation (2), in correspondence with the inner cavity (3), a weakened central area (5), comprising a security element (6) having a U-shaped laminar configuration, being able to be inserted by pressure and fitted in a recess (7) which the side faces (2') and the lower area (2'') of the radial prolongation (2) have, such that said security element (6) runs along the weakened central area (5) of the radial prolongation (2), where the configuration of the security element (6) corresponds with the configuration of the recess (7).
