Abstract (en)

[origin: US2014069776A1] A conveyor system having a roller-engagement mechanism and a method for conveying articles. The conveyor system includes an infeed conveyor feeding articles to a conveyor belt advancing in a direction of belt travel. The conveyor belt comprises obliquely rotatable rollers-single rollers or stacked sets of rollers-selectively activated by the roller-engagement mechanism. The roller-engagement mechanism has a rack supporting a plurality of flat belts. The flat belts advance in the direction of travel of the conveyor belt. The rack is movable between a first position in which the flat belts advancing with the conveyor belt contact the belt rollers to inhibit their rotation and carry articles atop the belt in the direction of belt travel and a second position in which the flat belts are out of contact with the belt rollers. In the second position, the roller-engagement mechanism can allow the belt rollers to rotate freely or can include a parallel set of elongated rollers between the flat belts put into rolling contact with the belt rollers to rotate them as the conveyor belt advances in the direction of belt travel.
