Abstract (en)
[origin: EP2897443A1] The present invention intends to eliminate the need for a temperature detecting element adapted to measure the temperature of a roll main body in an induction-heated roller apparatus, and includes: an impedance calculation part 61 that calculates the impedance of a winding 32; a relational data storage part 63 that stores relational data indicating the relationship between the impedance of the winding 32 and the temperature of the roll main body 2; and a roll temperature calculation part 64 that calculates the temperature of the roll main body 2 from the impedance obtained by the impedance calculation part 61 and the relational data stored in the relational data storage part 63.
