Abstract (en)

[origin: WO2014044942A1] The present invention concerns an electrolyte composition for depositing copper onto semi-conductive substrates covered with a barrier layer. This electrolyte contains a combination of imidazole and 2,2'-bipyridine, used as a suppressor, and thiodiglycolic acid, used as an accelerator. The combination of these additives makes it possible to obtain bottom-up filling on very narrow trenches, typically narrower than 100 nm.
