Abstract (en)

[origin: WO2014044434A1] The invention relates to a communications method that comprises the step of sending a query message (22) from a central entity (10) to at least one node (K1, K2, ..., KN). For every queried node, the central entity determines a node-specific time window based on a node-specific response time (T1, T2, ..., TN). The central entity filters out a response message (A1, A2,..., AN, B1, B2,..., BN), sent from the queried node, from the signals received during this time window. Based on the node-specific time window ($\Delta 2$), the central entity assigns the response message to the queried node. The invention also relates to a computing unit that is configured to operate as a central entity, to a communications system, as well as to a computer program and a computer-readable storage program with said computer program.
