Abstract (en)

[origin: US2015203255A1] A container, in particular a pallet container, having at least one side wall, a loading opening that can be closed by a flap, and a device for holding the flap in a closed position. The holding device includes a retainer, which is arranged on the side wall or on the flap and which is intended to hold the flap in the closed position and is designed so that the flap is movable to the closed position when a counterforce exerted by the retainer is overcome. The holding device holds the flap in the closed position by latching the flap on the retainer, by latching the retainer on the side wall, or by latching the retainer on a holding member that is provided to receive the retainer and is arranged on the flap or on the side wall.
