Abstract (en)

[origin: EP2899352A1] In an adjustable carriage unit (1), a base part (2), fixable to the top of a dividing element, and a carriage part (4), capable of connection to and movement along a guide rail by which the dividing element is suspended, are connected to each other by a connecting part (3) whose upper portion (31), associated with the carriage part (4), is adjustable in position relative to the base part (2) along an axis transversal to the line of movement of the carriage part (4). An adjustment screw (6) acts, either directly or through an actuating device (7), on a first lever arm (51) of an adjustment lever (5) which is hinged on the base part (2) about a first axis of rotation (50) perpendicular to the line of movement of the carriage part (4), causing the adjustment lever (5) to rotate either clockwise or anticlockwise about the first axis of rotation (50) and thereby moving the connecting part (3), which is engaged by its lower portion (30) to a second lever arm (52) of the adjustment lever (5).
