Abstract (en)

[origin: WO2014047667A1] A boundary element for road surfaces, in particular bridges, has a device for connecting the boundary element to a foundation (8). The boundary element has a basic body (1) with a longitudinal axis in the direction of travel, and also has a bearing surface (9) and a connecting element (7), which is connected to the basic body (1). A profile element (6) with a longitudinal direction (10) is connected to an anchoring element (3), wherein the anchoring element (3), which is used for the connection to the foundation (8), is connected to the profile element (6), and wherein the connection between the profile element (6) and the anchoring element (3) is at a distance from the bearing surface (9). The longitudinal direction (10) of the profile element extends at an angle (β) of greater than 45° , preferably approximately 90° , to the longitudinal axis of the basic body (1).
