Abstract (en)

[origin: WO2014048877A1] The invention relates to a method for stock-keeping and/or production optimization of at least one product, wherein the product is produced from at least two components, comprising the following steps and a step of providing: a first computer means, which is connected to at least one first database by means of a data connection, and at least one second computer means, which is connected to at least one second database by means of a data connection; wherein the second database is connected to the first computer means by means of a data connection and each second computer means is connected to the first database by means of a data connection, wherein the first and/or second databases contain data about the current inventory of the product and/or of the components of the product and the production plan of the product and/or of the components of the product. First, a first computer means determines all components of the product and preferably also the databases and thus the systems in which said components are produced. In the next step, the computer means determines the current inventory of the product and/or of the components of the product. Then the computer means determines the production plan of the product and/or of the components of the product. In the following step, the computer means compares the inventory for the reference date of at least one order with the quantity of the order. For this purpose, the computer means combines the current inventory of the product and/or of the components of the product and the inventory resulting from the production plan for the reference date of an order.
