Abstract (en)  
A bath chair having excellent usability of a handle opening and closing is provided. An insertion hole is formed on a support part of each front left and right of a base. A latching hole is provided to the insertion hole. A connection member is provided to a bottom face of a handle so as to be connected rotatably to the handle. A latching projection is provided to a lower part of the inserting projection, which is formed to be insertable into the insertion hole. A release push button and latching projection are provided to the connection member facing outer side. The latching projection is biased toward outer side direction. Pressing the release push button releases a latching between the latching projection and the latching hole, thus the handle can be opened.
