Abstract (en)

[origin: CN104819021A] The invention relates to an apparatus and method for operating at least one exhaust valve of a valve-controlled combustion engine, and specifically relates to the apparatus and method for operating at least one exhaust valve of the valve-controlled internal combustion engine for motor vehicles, in which, preferably in the force flow between a camshaft and at least one operating member acting on the exhaust valve actuator, at least one means is provided, by means of which the at least one outlet valve, particularly in an engine braking mode with exhaust back pressure, in a non-closed intermediate position is tenable. The invention is characterized in that the at least one means is formed by an integrated in the valve train stepping mechanism (9) which can be switched in a pulse-like actuation between regular valve actuation and at least one intermediate position, in particular, has an impulsive switchable character.
