Abstract (en)
[origin: WO2014037497A1] Drainage channels are known which comprise a drainage body (10) which can be built into a base and a cover (20) which can be mounted on the drainage body (10). To increase stability, the drainage body (10) comprises, on each of the two upper edges (11, 11'), two higher channel supports (12, 12') and two lower channel supports (13, 13') offset inwards in terms of the distance thereof to a central longitudinal plane, outer cover supports (22, 22') formed correspondingly to the cover (20) and inner cover supports (23, 23') which are formed in such a manner that all channel supports (12-13') engage with all cover supports (22-23') under loading, wherein the higher channel supports have a gap to the corresponding outer cover supports in the unloaded state, wherein this gap is closed under loading because of the elasticity present.
