Abstract (en)

[origin: WO2014053511A1] The present invention relates to a honeycomb body (4) made of ceramic material having channels (11) separated from one another by walls (10), an anterior end face (2), a posterior end face (3) and a lateral surface (4). A fluid can flow through the honeycomb body in a flow direction (S) from the anterior end face (2) to the posterior end face (3). The honeycomb body (4) is less electrically conductive in at least one first portion (5) than in at least one second portion (6), the portions (5, 6) lying one after another in the flow direction (S). Such a honeycomb body (4) is produced using a method according to which a honeycomb body (4) is produced by extruding poorly electrically conductive ceramic material, the honeycomb body (4) being treated after extrusion in at least one second portion (6, 7) such that the electrical conductivity in said second portion (6, 7) is increased, whereas it remains unchanged in at least one first portion (5), the portions (5, 6, 7) lying one after another in the flow direction (S).
