Abstract (en)  
[origin: US2014108937A1] Configuration models are accessed, each configuration model defining configuration attributes to be collected from a respective one of compute, storage, and network components of a converged infrastructure and collecting actual configuration attributes from each of the compute, storage, and network components of the converged infrastructure in accordance with the configuration models. A policy is accessed that defines configuration attribute rules corresponding to each of the configuration attributes collected from the compute, storage, and network components and comparing the collected configuration attributes to the configuration attribute rules for each of the compute, storage, and network components. Results of the comparing are reported, including which of the collected configuration attributes violate the corresponding configuration rules.
