Abstract (en)

A method of cutting a laminate sheet in which a plurality of sheet members are assembled to form fiber-reinforced plastic, includes: a cutter-placing step of placing at least one cutter which extends in a thickness direction of the laminate sheet, on the laminate sheet at a plurality of positions in a longitudinal direction of the laminate sheet; and a cutting step, after the cutter-placing step, of cutting the laminate sheet by pressing the at least one cutter into the laminate sheet in the thickness direction. In the cutting step, at the plurality of positions, respective pressing-in amounts by which the at least one cutter is pressed into the laminate sheet are varied from one another so that an end of the laminate sheet is cut to have a stair shape.
