Abstract (en)
[origin: WO2014060694A1] The invention relates to a container (10) for a liquid, comprising a pouch (12) for containing a liquid (L), said pouch defining an inner surface and comprising an upper part (14) and a hole. The invention is characterised in that the pouch also comprises a channeling device (28) fixed to the inner surface of the upper part thereof by means of two fixing areas extending either side of the hole, the channeling device covering said opening and having at least one channel for the flow of the liquid towards the hole, and a first and a second longitudinal end, one of which forms an opening between the channeling device and the inner surface of the upper part of the pouch, the channeling device comprising a first and a second longitudinal end arranged either side of the hole, the fixing areas being arranged along the first and second longitudinal edges such that the filling and/or emptying of the pouch is achieved by the liquid flowing through the hole and said at least one opening formed between the channeling device and the inner surface of the pouch.
