Abstract (en)

[origin: WO2014063932A1] The invention relates to a device for producing variable optical security features (1), comprising: a set of security feature components (7), which are stored in a file and the optical individual representation of which has an individual background line pattern (5), into which pattern a respective individual motif (4) is embedded that has an individual motif line pattern (6), the recognizability of the motif to the human eye being increased by viewing with a decoding means (20); a selecting means, with which individual security feature components (7) can be selected from the set of security feature components and combined to form the security feature (1); and a printing device for optical representation of the variable security feature (1), the recognizability of which to the human eye is increased by viewing with the decoding means (20).
