Abstract (en)
[origin: WO2014067892A1] A workstation luminaire has a light source (3) for generating a light, a first light exit surface region (1), which is flat, at least in a first approximation, and which is fixed by a first surface normal (N1), and a second light exit surface region (2), which is flat at least in a first approximation and which is fixed by a second surface normal (N2). The workstation luminaire is configured such that a first proportion of the light in the form of a first luminous flux (L1) leaves the workstation luminaire through the first light exit surface region (1) and a second proportion of the light in the form of a second luminous flux (L2) leaves through the second light exit surface region (2), wherein the first surface normal (N1) encloses an angle (α) with the second surface normal (N2) which is between 10° and 90°, preferably between 30° and 90°.
