Abstract (en)

[origin: WO2014067836A1] A method for managing the cooling of an engine system equipped with a partial exhaust gas recirculation device using a cooling circuit comprising a hybrid circuit with a first and second loop for the circulation of heat transfer fluid for cooling a unit heater and an engine respectively, and a third loop for circulating heat-transfer fluid for cooling the partial exhaust gas recirculation device, the method involving: receiving (201) at least one value of a parameter relating to the engine system (TM, state\_EGR, pedal\_pos, engine\_speed), formulating (202, 203, 204) a control signal for the third loop (S) dependent on said at least one value received, so as to reduce the cooling of the partial exhaust gas recirculation device, and sending (205) the control signal to the third loop so as to adapt the cooling to the engine system situation.
