Abstract (en)
[origin: WO2014067564A1] The invention relates to a timepiece comprising: a casing (10) with a bottom (12), a middle (14) and a control body (16) mounted movably in relation to the middle (14), a movement (18) housed in the casing (14), a glass (26) closing the casing, a dial (28) arranged between the movement (18) and the glass (26), said dial (28) comprising two polarised lenses (28a, 28b), at least one of which is mounted on a mobile frame (30), such that said polarised lenses (28a, 28b) can assume a first state wherein elements arranged behind the dial (28) in relation to the glass (26) are visible from the side of the glass (26) and a second state wherein said elements are hidden. A kinematic connection is arranged between the control body (16) and the mobile frame (30), said kinematic connection comprising a first toothing secured to the control body, a second toothing secured to the mobile frame and arranged in a different plane from that of the first toothing, and a setting-wheel train kinematically connecting the first toothing and the second toothing. The setting-wheel train is pivoted on the middle (14) and comprises at least two moving parts arranged in the same plane parallel to the plane defined by the movement (18), and at least two moving parts that are interconnected by a shaft pivoted on the middle (14) and orthogonal thereto.
