Abstract (en)

[origin: WO2014068340A1] Systems and methods are disclosed for processing content of a web resource for display, where the web resource has at least one dimension exceeding an initial viewable area of a browser of a display device. The web resource is retrieved and information from the web resource rendered in the browser. However, rendering of a content unit for a portion of the web resource outside the initial viewable area is delayed. An event is detected indicating a change of the initial viewable area to a secondary viewable area and, on detection of the event, the content unit is rendered. The secondary viewable area may contain that outside portion of the web resource. The event may be triggered by a user, for example by a user interaction with a rendered web resource, and may be a movement event, such as a scroll event.
