Abstract (en)
[origin: WO2014071954A1] The invention relates to a packaging and a system for transporting the packaging. The system has two load carriers (1,1') with handles (2,2'), and each load carrier comprises four side faces (5) and a base part having a top face and a bottom face. The base part comprises holding parts (4) for retaining the packaging to the effect that two charged load carriers can be stacked with packaging arranged between the two load carriers. The side faces comprise an upper edge and a lower edge that are mutually adapted with engagement means (20) to the effect that the two load carriers can be stacked without the packaging arranged between the two load carriers. Besides, the load carriers each individually comprises a handle which is located above an opening (6) in the base of the load carriers and such that the centre of gravity of the load carriers is below the handle. The handle is configured with a hollow and a length being adapted to the packaging to the effect that the handle from the underlying load carrier is received in the handle of the superposed load carrier, when the two load carriers are stacked with or without packaging arranged between the two load carriers.
