Abstract (en)

[origin: WO2014076178A1] The invention relates to a method for making masonry work and masonry (1) made by assembling a plurality of bricks and/or building blocks (2) of the hollow type with a hollow space percentage equal to or greater than 15% and permanently bonding the adjacent bricks and/or building blocks (2) together by means of a polyurethane binder (3); the bricks and/or building blocks (2) are laid with the axis (1) of the respective perforations, holes or cavities (4), orthogonal to the plane (P), and are bonded together by means of the polyurethane binder (3) which is disposed inside of one or more perforations, holes or cavities (4) of the bricks and/or building blocks (2) which are permanently bonded in a reciprocal manner, and furthermore to a system of a plurality of bricks and/or building blocks (2) of the hollow type with a percentage of holes greater than or equal to 15% for the construction of a wall or a wall element and a liquid polymeric binder (3), in particular, an at least two component polyurethane binder (3) for the construction of masonry work (1), a wall or a wall element and the use of such a system for the construction of masonry work (1).
