Abstract (en)
[origin: CA2890836A1] The invention relates to a projectile, comprising a projectile bottom (1), an adjacent cylindrical rear region (2), and a front region (3), which is designed as an ogive. The projectile has one or two projectile cores (4, 5) and a projectile jacket (6). In order that the projectile core and the projectile jacket simultaneously begin to deform to twice or three times the projectile diameter when the projectile hits the body of a wild animal, according to the invention, the projectile core (4) in the cylindrical rear region (2) is soldered to the projectile jacket (6) over the entire axial length of the projectile core.
