Abstract (en)

[origin: WO2014080334A1] Device for the fluid-tight conservation of a first substance to be mixed with a second substance, which is contained in a container (1) comprising an outer concave cap (2) comprising an edge portion (21) adapted to seal the mouth (11) of the container, and having, on the upper side, a deformable portion (22) and, on the lower side, a conical portion (23), which can be inserted, by applying pressure, into said mouth of the container, inside which a chamber (C) to contain said first substance is defined. The device comprises, furthermore, a breaking element (3) comprising a stem (31), which, at its upper end, substantially strikes from the inside the deformable portion of the cap and is able to move downwards after a pressure has been applied onto said deformable portion of the cap, and holding means to hold said element inside the cap after said pressure has been applied onto the cap itself, said means being adapted to prevent the element itself from keeping moving downwards outside the cap.
