Abstract (en)

[origin: WO2014079558A1] The invention relates to a device (1) for the electrical attachment or connection of at least one conductor (2, 6) of an energy supply cable (4, 8), wherein the device (1) has a first connection element (10), which is connectable to the conductor (2, 4) and is connectable to a second connection element (20) of the device (1) by means of a clamping element (30). The two connection elements (10, 20) each have a cylindrical, more particularly a circular cylindrical, circumferential face (12, 22), at least in some portions, and a longitudinal axis (14, 24) centred in relation thereto. The central longitudinal axes (14, 24) of the two connection elements (10, 20) align in the connected state, and one of the two connection elements (10, 20) can be brought together with the other of the two connection elements (10, 20) in a rotary position, which is freely selectable from an angle range in relation to its central longitudinal axis (14, 24), and can be connected to the other of the two connection elements (10, 20) in the selected rotary position.
