Abstract (en)
A filter of the invention includes: a capsule CA having a tubular shape and including a peripheral wall 10 constituting a peripheral surface of the tubular shape and a pair of end walls 11, 12 closing front and rear openings of the tubular shape, respectively, the capsule having a liquid encapsulated therein, at least the peripheral wall 10 being elastically deformable, and the peripheral wall being provided with at least one ring-shaped main thin-walled region 10a extending in a peripheral direction of the peripheral wall or with at least one straight main thin-walled region 10c extending in an axial direction perpendicular to the peripheral direction; and a generally cylindrical filter body having an accommodation space 204 in which the capsule CA is accommodated, wherein the capsule is disposed within the accommodation space such that the ring-shaped main thin-walled region 10a or the straight main thin-walled region 10c is directed parallel to a radial direction of the filter body.
