Abstract (en)

[origin: WO2014082848A1] The invention relates to a connecting device, comprising a clip element, which has a section that is elastic in a radial direction and that can be clipped onto a male fastening element while being elastically expanded in the process, and a securing element, which can be slid onto the clip element in a sliding direction, in particular when the clip element is clipped onto a male fastening element, wherein the securing element has a sleeve-like section, which is in contact with the elastic section of the clip element from the outside when the securing element is slid onto the clip element. The clip element and the securing element are injection-molded from the same plastic material or from different plastic materials.
