Abstract (en)

[origin: WO2014086580A1] The aim of the invention is to provide an advantageously economical method for merging electric and optical signals. This is achieved by a method for merging at least one first signal transported via at least one light guide (10) of at least one light guide cable (12) and at least one second signal transported via at least one first conductor pair (14) of at least one first electric cable (16) onto at least one second conductor pair (18) of at least one second electric cable (20), in particular by means of at least one DSLAM (22), wherein the at least one first electric cable (16), the at least one second electric cable (20), and the at least one light guide cable (12) are fed to at least one common sleeve connecting device (24).
