Abstract (en)

Movable blade 40 of hair clippers includes a plurality of unit blades 41. Distal region 50, intermediate region 60, and root region 70 that have mutually different bevel angles are arranged in the longitudinal direction of each unit blade 41. Distal region 50 is formed on the tip side of unit blade 41, and has a bevel angle which is less liable to cause irritation to a target region compared with intermediate region 60 and root region 70. Root region 70 is formed on the root side of unit blade 41, and has a bevel angle having a lower cut resistance to the hair compared with distal region 50 and intermediate region 60. Intermediate region 60 is formed between distal region 50 and root region 70 of unit blade 41, and has a bevel angle set so that the bevel angle smoothly varies from distal region 50 toward root region 70. The present disclosure can provide hair clippers that are inhibited from applying strong irritation to a target region, a head unit thereof, and a movable blade thereof.
