Abstract (en)

[origin: WO2014088418A1] A hydronic system (1) is disclosed which comprises a central unit (2), a number of radiator units (4) each provided with a thermostatic radiator valve (TRV), a supply path (6) and return path(8) for transporting the fluid from the central unit to the number of radiators and back, a bypass valve (11), an outdoor temperature sensor (14) configured for sensing the outdoor temperature and to generate an outdoor temperature signal (tout) and a control unit (16) configured to receive the outdoor temperature signal (tout). The system (1) further comprises at the return path a sensor (18) generating a heat signal (tret) indicative for the minimal amount of heat actually circulated in the hydronic system (1).The control unit (16) is further configured to receive the heat signal (tret) and to control the central unit (2) in response to the heat signal (tret) and the outdoor temperature signal (tout).
